

What is claimed is

1. An oscillating switch comprising:

a lower casing;

a contact circuit member provided on the lower
5 casing and including a through hole;

a rubber switch member provided on the contact
circuit member and including a pair of rubber contact
portions and a through hole;

an upper casing for covering the rubber switch
10 member;

an operating knob pivotally supported by the upper
casing;

pressing portions formed on the operating knob so
as to depress the corresponding rubber contact portions,
15 respectively; and

a click feeling-producing mechanism, for
producing a suitable click feeling when the operating
knob is operated, which passing through the through
holes of the contact circuit member and the rubber switch
20 member, wherein the click feeling-producing mechanism
includes,

a cam surface formed on one of the operating
knob and the lower casing,

a pressing element formed on the other of
25 the operating knob and the lower casing, and

a urging member for urging the pressing element to the cam surface.

2. The oscillating switch according to claim 1,
5 wherein the cam surface is formed on a distal end of an operating portion which projects from the operating knob and passes through the through holes of the contact circuit member and the rubber switch member, and the urging member is received and held in a receiving recess
10 in the lower casing.
